## 2. Assessment Methodology

### 2.1 Environmental Impact Assessment Approach and Scope

- 2.1.1 This Preliminary Environmental Information (PEI) Report has been prepared to satisfy the requirements of The Infrastructure Planning (Environmental Impact Assessment) Regulations 2017 (as amended) ('the EIA Regulations') in relation to the proposed Development Consent Order (DCO) application ('the Application') outlined within Chapter 1: Introduction (PEI Report, Volume I).
- 2.1.2 In preparing this PEI Report, reference has been made to the following guidance:
- Advice Note Three: EIA Notification and Consultation (Planning Inspectorate (PINS), 2017a);
  - Advice Note Seven: Environmental Impact Assessment, Process, Preliminary Environmental Information and Environmental Statements (PINS, 2017b);
  - Advice Note Nine: Rochdale Envelope (PINS, 2018); and
  - Advice Note Seventeen: Cumulative Effects Assessment relevant to nationally significant infrastructure projects (PINS, 2019).
- 2.1.3 Reference has also been made to the Scoping Opinion received from the Secretary of State (SoS) dated 2<sup>nd</sup> of April 2019 (Appendix 1B: Scoping Opinion, PEI Report, Volume III) and the advice contained within it regarding assessment methodology, topics and presentation of the final Environmental Statement (ES).
- 2.1.4 In response to the Scoping Opinion, the EIA and this PEI Report will include assessments of the following environmental topics:
- air quality;
  - hydrology and water resources;
  - geology and hydrogeology;
  - noise and vibration;
  - terrestrial ecology (including ornithology) and nature conservation;
  - aquatic ecology and nature conservation;
  - marine ecology and nature conservation;
  - Habitats Regulation Assessment (HRA);
  - traffic and transportation;
  - landscape and visual amenity;

- archaeology and cultural heritage;
- socio-economics and tourism;
- climate change;
- major accidents and disasters;
- population and human health; and
- cumulative and combined effects.

2.1.5 The SoS's Scoping Opinion (Appendix 1A: Scoping Opinion, PEI Report, Volume III) concluded that a number of topics did not need to be considered as part of the EIA for the Proposed Development and could therefore be scoped out. These topics include:

- emissions to air from operation of the connection infrastructure;
- emissions to air from operational traffic;
- operational noise and vibration from traffic; and
- detailed assessment of operational traffic impacts.

## 2.2 Preliminary Environmental Information Report

2.2.1 This PEI Report presents a description of the Proposed Development and its likely significant environmental effects on the environment during construction, operation (including maintenance where relevant) and decommissioning, based on the preliminary environmental information available at the time of the assessment (Spring 2020). It also details measures to avoid or reduce such effects and the alternatives considered.

2.2.2 This PEI Report includes a summary of the following activities in a level of detail considered sufficient to inform consultees for the purposes of the consultation and based on the information available:

- establishing the baseline conditions;
- consultation with statutory and non-statutory consultees;
- consideration of relevant local, regional and national planning policies, guidelines;
- adherence to legislation relevant to EIA;
- consideration of technical standards for the development of significance criteria;
- application of specialist assessment methodologies;
- design review;
- review of secondary information, previous environmental studies, publicly available information and databases;
- expert opinion;
- physical surveys and monitoring;

- desk-top studies;
  - modelling and calculations; and
  - reference to current guidance.
- 2.2.3 These activities enable the prediction of impacts in relation to the baseline, and a prediction based on the information available of the likely significance of effects on environmental receptors.
- 2.2.4 The term ‘impact’ refers to changes arising from the Proposed Development, whereas the term ‘effect’ is used to describe the result of the impact on a receptor.
- 2.2.5 The technical chapters within this PEI Report (Chapters 8 to 22) each follow the same structure for ease of reference, which is:
- introduction;
  - legislation and planning policy context;
  - assessment methodology and significance criteria;
  - baseline conditions;
  - development design and impact avoidance;
  - likely impacts and effects;
  - mitigation and enhancement measures;
  - limitations;
  - residual effects and conclusions; and
  - references.

## 2.3 Study Areas: Spatial Scope of Assessment

- 2.3.1 The assessment chapters of this PEI Report (Chapters 8 to 22) describe, as necessary, their spatial scope including their rationale for determining the specific area within which the assessment is focussed. The study areas are a function of the nature of the impacts and the locations of potentially affected environmental resources or receptors.

## 2.4 Assessment Years and Assessment Scenarios: Temporal Scope of Assessment

- 2.4.1 The approach to assessment has been to assess the environmental impacts of the Proposed Development at key stages in its construction, operation and eventual decommissioning.

### Baseline Conditions (including Future Baseline)

- 2.4.2 In order to assess the potential impacts and effects of the Proposed Development, it is necessary to determine the environmental conditions that currently exist on the Site and in the surrounding area. These are known as the existing baseline conditions. Baseline conditions are determined using

the results of site surveys and investigations or desk-based data searches, or a combination of these, as appropriate.

- 2.4.3 It is also relevant for the EIA to consider future baseline conditions taking account of any planned or likely changes to the existing baseline.
- 2.4.4 The 'existing baseline' date is 2018 - 2020 since this is the period in which the baseline studies for the EIA have been and are being undertaken. 'future baseline' conditions are also predicted for each assessment scenario, whereby the conditions anticipated to prevail at a certain point in the future (assuming the Proposed Development does not progress) are identified for comparison with the predicted conditions with the Proposed Development. The assessment scenarios that are being considered for the purposes of the EIA (and considered in this PEI Report) are as follows:
- existing baseline (without Proposed Development) – the year that baseline data has been collected;
  - future baseline (without the Proposed Development), for comparison respectively with the construction, opening, operation and decommissioning scenarios listed below;
  - construction of the Proposed Development. Chapters 8 to 22 (PEI Report, Volume I) identify and assess the relevant 'worst case' construction scenario for each topic and where necessary, particular chapters identify the relevant period or 'peak' of activity within the three year construction programme;
  - opening and/or operation of the Proposed Development, (where opening represents the start of operation) – as for construction, Chapters 8 to 22 (PEI Report, Volume I) identify and assess the relevant 'worst case' scenario for each topic where necessary; and
  - decommissioning of the Proposed Development.

## 2.5 Development Design, Impact Avoidance and Mitigation

- 2.5.1 Measures that have been integrated into the Proposed Development in order to avoid or reduce adverse environmental effects will be described. Such measures may include refinement of the design and layout of the Proposed Development to avoid impacts on sensitive receptors, implementation of Environmental Management Plans (EMP), and adherence to relevant legislation, guidance and best practice. The assessment of impacts and effects has been undertaken on the basis of these measures being implemented (i.e. they are 'embedded mitigation').
- 2.5.2 The key aspects where the design has evolved are described in Chapter 6: Need, Alternatives and Design Evolution (PEI Report, Volume I).
- 2.5.3 Once the likely effects have been identified and quantified, consideration has then been given to any further mitigation (over and above anything identified within the Development Design and Impact Avoidance sections of each technical chapter) that may be required to mitigate any significant adverse

effects identified. These measures are described in the Mitigation and Enhancement Measures sections of Chapters 8 to 22 (PEI Report, Volume I). The residual effects (after the implementation of mitigation) are then assessed and presented at the end of Chapters 8 to 22. Significant residual effects are also summarised in Chapter 25: Summary of Significant Effects (PEI Report, Volume I).

- 2.5.1 In general implementation of the impact avoidance and minimisation measures relied on in the assessment will be secured through the most appropriate means. In many cases this will be through the DCO, such as via the setting of limits of deviation (e.g. specific Above Ordnance Datum (AOD) heights and fixed grid references for emission points) or through DCO requirements (similar to planning conditions) in relation to mitigation measures. Measures may also be secured through other means, such as existing legislation or the environmental permit that will need to be obtained to operate the Proposed Development.

## 2.6 Impact Assessment Methodology and Significance Criteria

- 2.6.1 Impacts are defined as changes arising from the Proposed Development, and consideration of the result of these impacts on environmental receptors enables the identification of associated effects, and their classification (major, moderate, minor and negligible, and adverse, neutral or beneficial). Each effect has been classified both before and after mitigation measures have been applied. Effects after mitigation are referred to as 'residual effects'.
- 2.6.2 The classification of effects is undertaken with due regard to the following:
- extent (local, regional or national) and magnitude of the impact;
  - duration (whether short, medium or long-term);
  - nature (whether direct or indirect, reversible or irreversible);
  - whether the effects occur in isolation, are cumulative or interactive;
  - performance against environmental quality standards and in the context of relevant legislation, standards and accepted criteria;
  - number of receptors affected;
  - sensitivity of receptors;
  - compatibility with environmental policies; and
  - professional experience and judgement of the assessor.
- 2.6.3 Further details are provided in Chapters 8 to 22 (PEI Report, Volume I).
- 2.6.4 Where it has not been possible to quantify effects, qualitative assessments have been undertaken, based on available knowledge and professional judgment. Where any uncertainty exists, this has been noted in the relevant technical chapter in the limitations section of each of Chapters 8 to 22.

- 2.6.5 To enable comparison between technical topics and aid understanding of the EIA findings, standard terms are used wherever possible to classify effects throughout this PEI Report (major, moderate, minor and negligible), and effects are also described as being adverse, neutral or beneficial. Where the quality standards for each technical discipline result in deviations in the standard assessment methodology, these are described in the relevant chapters, as applicable.
- 2.6.6 Definitions of the standard terms are provided below:
- negligible – imperceptible effect to an environmental resource or receptor;
  - minor – slight, very short or highly localised effect;
  - moderate – limited effect (by extent, duration or magnitude);
  - major – considerable effect (by extent, duration or magnitude) of more than a local scale or in breach of recognised acceptability, legislation, policy or standards;
  - adverse – detrimental or negative effects to an environmental resource or receptor;
  - neutral – effects to an environmental resource or receptor that are neither advantageous or detrimental; and
  - beneficial – advantageous or positive effect to an environmental resource or receptor.
- 2.6.7 Moderate and major effects are generally considered to be ‘significant’ for the purposes of the EIA Regulations, in accordance with standard EIA practice.
- 2.6.8 Each of the technical chapters provides further description and definition of the assessment criteria relevant to each topic. Where possible, this has been based upon quantitative and accepted criteria (for example British Standards), together with the use of value judgment and expert interpretation to classify effects.
- 2.6.9 In general, the classification of an effect is based on the magnitude of the impact and sensitivity or importance of the receptor, using the matrix shown in Table 2-1. Where there are deviations away from this matrix (due to the technical guidance for a specific assessment topic), this is highlighted within the relevant technical chapter and the reason for the variation explained.

**Table 2-1: Classification of Effects**

| Magnitude of Impact | Sensitivity /Importance of Receptor |            |            |            |
|---------------------|-------------------------------------|------------|------------|------------|
|                     | High                                | Medium     | Low        | Very Low   |
| High                | Major                               | Major      | Moderate   | Minor      |
| Medium              | Major                               | Moderate   | Minor      | Negligible |
| Low                 | Moderate                            | Minor      | Negligible | Negligible |
| Very Low            | Minor                               | Negligible | Negligible | Negligible |

2.6.10 Short term effects are those associated with the site preparation and construction phase and which cease when construction works are completed. Long term effects are those associated with the completed, operational development and which last for the duration of the operational phase. Effects may also be permanent (irreversible) or temporary (reversible) and direct or indirect.

2.6.11 There are no significant transboundary effects associated with the Proposed Development.

## 2.7 Cumulative and Combined Effects

2.7.1 In accordance with the EIA Regulations, consideration is given to the potential for cumulative and combined effects to arise as a result of the Proposed Development.

2.7.2 Cumulative effects are those that accrue over time and space from a number of development activities. The impact of the Proposed Development will be considered in conjunction with the potential impacts from other projects or activities which are reasonably foreseeable in terms of delivery. This includes projects that have been submitted but have not yet been approved or have planning permission or development consent that are located within a geographical scope where environmental impacts could act together to create a more significant overall effect on a receptor and where sufficient environmental information is available.

2.7.3 Combined effects are those resulting from a single development, in this case the 'Proposed Development,' on any one receptor that may collectively cause a greater effect (such as the combined effects of noise and air quality/dust impacts during construction on local residents).

2.7.4 Cumulative and combined effects are discussed in Chapter 24: Cumulative and Combined Effects (PEI Report, Volume I).
